Section Overview

Load Control Valves

Load control valves

Eaton offers a broad range of Vickers load control valving including counterbalance, motion control and pilot operated check valves. The prime function of load controls is to prevent loads from running ahead of pump supply and/or to provide positive load holding. These valves provide precise and stable motion control. Load control valves are ideally suited for moving and positioning systems.

These products include both threaded cartridge and inline housing valves to meet the majority of load control requirements.

Load control application tips

3-ported counterbalance valves

These valves are used with an open center on/off directional valve for:

- Precise control of overrunning loads
- Protection from pump cavitation
- Preventing actuator from running ahead of the pump supply and
- Providing load holding and hose failure safety

Vented (4-ported) counterbalance valves

These valves are used for:

- Precise control of overrunning loads
- Regenerative cylinder circuits
- Meter-out control and providing load holding and hose failure safety with proportional control valves

Pilot operated check valves

These valves are used:

- For position load locking
- As an alternative to counterbalance valves where neither the overrunning loads or release speed are factors in the application.
- Pilot operated check valves are covered in section G

Counterbalance cartridges, 3-ported

The CBV are single cartridge type counterbalance valves that have:

- A check feature allowing free flow in one direction
- A relief feature controlling flow in the other direction
- A pilot signal that overrides the relief setting providing the counterbalance function.

The CBV*-10 series products are capable of handling flows to up 60 L/min (15 USgpm) and pressures up to 350 bar (5000 psi).

The CBV*-12 series products are capable of handling flows up to 114 L/min (30 USgpm) and pressures up to 350 bar (5000 psi).

These valves are available with 4:1 and 10:1 pilot ratios. As a general rule, a low pilot ratio will provide better motion control and stability in systems with higher capacitance (spongy) and inductance (high inertial loads). A high pilot ratio improves the efficiency of a hydraulic system, but motion control stability may suffer.

The 3-ported counterbalance valves are offered with a wide variety of standard housings with SAE and BSPP port options. Aluminum and steel housings are available in the following styles:

- Inline single
- Inline dual
- Inline dual, with integral shuttle
- SAE 4-bolt, Code 61
- Close coupled, nipple mounted
- Gasket mounted single
- Gasket mounted dual
- Various bolt on manifolds for Eaton hydraulic motors

Vented counterbalance cartridges, 4-ported

The VCB1-10 and VCB1-12 are single cartridge type counterbalance valves that have:

- A check feature that allows free flow in one direction
- A relief feature that controls flow in the other direction and
- A pilot signal that overrides the relief setting, providing the counterbalance function

The additional 4th port on this valve provides an external drain that makes the valve insensitive to back pressure at port 2, when the valve is piloted open. This is particularly useful in regenerative circuits, meter-out circuits, servo valves and proportional valves circuits. This valve is available with a 4:1 pilot ratio. The

4-ported counterbalance valve is offered with a wide variety of standard housings with SAE and BSPP port options.

NOTE: For applications where the flow rate will not exceed 37,8 L/min (10 USgpm) for VCB1-10 and 95 L/min (25 USgpm) for VCB1-12, the standard C-**-4 housing can be used. For applications over those flows or those that require a reduced pressure drop, housings with the slot feature or a C-**-4U cavity are required.

Aluminum and steel housings are available in the following styles:

- Inline single
- Inline dual
- Gasket mounted single

Motion control valves

These are inline housing type motion control or counterbalance valves that utilize separate cartridges to perform the counterbalance function as described in the 3-ported version. The 16 and 20 series valves are available in both single and dual functions. The 16 series is capable of handling flows up to 151 L/min (40 USgpm) and pressures up to 210 bar (3000 psi). The 20 series valves are capable of handling 190 L/min (50 USgpm) and pressures up to 210 bar (3000 psi). Both series offer a 10:1 pilot ratio.

Features and benefits of counterbalance & motion controls:

- Positive load holding in any position.
- Thermal expansion relief protection.
- Cartridge valves may be installed directly into cavities machined in the actuator body. This reduces the number of potential leak points and simplifies plumbing.
- Line mounting of single or dual functions can simplify installation of load control valves in many applications.
- Dual function models that can introduce low-pressure makeup flow to prevent cavitation can be line mounted in hydrostatic transmissions.
- When used with paired cylinders, counterbalance valves will help to balance the load by transferring part of the load from the heavily loaded cylinder to the less loaded cylinder.
- When used with an open center directional control valve, deceleration control can be provided.

Adjusting counterbalance cartridge valve pressure setting:

Counterbalance valves adjust in the opposite direction of other pressure control valves. Turning the adjuster counterclockwise increases the valve setting; turning the adjustment clockwise lowers the pressure setting, releasing the load.

1. Loosen the jam nut.
2. Turn the adjusting screw clockwise to reduce the pressure setting, or counterclockwise to increase the pressure setting.

Do not remove the spring wire from the adjusting screw.

3. Tighten the jam nut to secure the desired pressure setting.

NOTE CBV*-10 spring wire must not be removed. Removal will affect the minimum adjustment of the valve.

CAUTION

Care should be taken to ensure the load is supported by mechanical means when servicing or removing the cartridge valve.

CAUTION

Hydraulically released "dead-man" brakes should be used to lock static loads due to motor and cylinder leakage.

CAUTION

Counterbalance valves can be damaged by severe decompression shock. To help prevent shock damage, a restriction may be added between the cylinder and the counterbalance valve.

CAUTION

Counterbalance valves are not relief valves or energy-saving devices. Stability problems may be encountered when system operating pressure goes below 50 bar (700 psi).

Pilot operated check valves

The POC*-10 and POC*-12 series of pilot-to-open check valves complement the CBV*-10 and CBV*-12 counterbalance cartridges and are physically interchangeable with them. The POC's provide a low cost alternative to load control when the dynamics of neither overrunning loads nor load release speed are factors to be considered in the design of the hydraulic circuit for the load to be controlled.

The pilot-to-open valves positively lock a load from port 1 to port 2 until pilot pressure applied to port 3 is sufficient to unseat the valve. This then permits flow from port 1 to port 2. The load can also be released through means of an optional screw type override.

The POC*-10 covers flow up to 60 L/min (15 USgpm). The POC*-12 covers flow up to 114 L/min (30 USgpm). With infinite life qualification to a fatigue pressure rating of 310 bar (4500 psi), these POC valves are suitable for use in a broad range of load control applications with typical system operating pressures up to 350 bar (5000 psi). Tailoring of the circuit to gain energy savings while minimizing shock is obtained through the use of several standard cracking pressure ranges from 2,0 bar (30 psi) to 7 bar (100 psi). When anti-cavitation protection is required, the 0,30 bar (5 psi) spring should be used. For those applications where pilot pressure may not always be available, the valve can be ordered with an optional adjustable override.

Pilot-to-open valves are suitable for a wide range of applications including aerial work platforms, boom truck, machine tool and round bailer markets.

Pilot operated check valves are covered in section G.

Features and benefits of pilot operated check valves:

- Simple load holding device. Low cost alternative to more complex solutions when overrunning loads are not present and / or control of load release speed is not required.
- Provides high operational efficiency and low spring settings.
- Valves are offered with a wide variety of standard

housings with SAE and BSPP port options in the following configurations:

- Inline single
- Inline dual
- SAE, 4-bolt
- Close coupled, nipple mounted
- Gasket mounted single
- Gasket mounted dual

These valves fit into C*-3S cavities.

- Four standard cracking pressures permit energy savings, while tailoring the hydraulic system requirements to minimize shock.
- Unique dual spring design provides high operational efficiency and a low pressure spring option for effective anti-cavitation protection.
- Unique design provides compact package and low pressure drops that match or exceed current market expectations and provide for excellent repeatability and stability.
- 3:1 pilot ratio satisfies simple load holding application requirements, while providing smooth operation and longer operating life.
- Optional adjustable override releases the load for situations where pilot pressure is not always available.

WARNING

Do not use Pilot-to-open check valves in load

holding applications where either overrunning loads are possible or load release speed is critical. Failure to observe these guidelines may result in bodily injury or damage to equipment.

WARNING

For pressure over 210 bar (3000 psi) use steel housings.

CBV1/2-10

Counterbalance valve

Description

The CBV*-10 is a 3-ported, externally piloted, screw-in cartridge type counterbalance valve.

Operation

The CBV counterbalance valve allows free flow from port 2 (inlet) to port 1 (load).

Flow from port 1 to port 2 is blocked until either the predetermined pressure

setting has been reached or sufficient pilot pressure has been applied to port 3 (pilot).

RATINGS AND SPECIFICATIONS

Performance data is typical with fluid at 21,8 cSt (105 SUS) and 49°C (120°F)

Typical application pressure (all ports)	350 bar (5000 psi)
Cartridge fatigue pressure (infinite life)	350 bar (5000 psi)
Rated flow	60 L/min (15 USgpm)
Cracking pressure @ 1 L/min (0.25 USgpm)	30 - 62-210 bar (900-3000 psi) 50 - 186-350 bar (2700-5000 psi)
Internal leakage	5 drops/min. max. Port 1 to Port 2 @ 77% of crack pressure
Temperature range	-40° to 120°C (-40° to 248°F)
Cavity	C-10-3S
Pilot ratio	4:1, 10:1
Fluids	All general purpose hydraulic fluids such as: MIL-H-5606, SAE 10, SAE 20, etc.
Filtration	Cleanliness code 18/16/13
Standard housing materials	Aluminum or steel
Weight cartridge only	0,23 kg. (0.50 lbs.)
Seal kit	02-173019 Buna-N 02-173020 Viton®

Viton is a registered trademark of E.I. DuPont

CAUTION

Adjustments exceeding 350 bar (5000 psi) may damage the body.

WARNING

For pressure over 210 bar (3000 psi) use steel housing.

S - Screw with locknut
C - Cap over screw
K - Hand knob

6 Valve Body
O - Cartridge only
I - Inline body
G - Gasket mounted, single
D - Dual counterbalance, line mounted

7 Housing port sizes

PORT SIZE	VALVE BODY CODES			
	I/D Alum.	Steel	G Alum.	Steel
SAE 8	-	-	A8T**	S8T**
SAE 10	A10T	S10T	-	-
SAE 12	A12T**	S12T**	-	-
3/8" BSPP	-	-	A4G**	S4G**
1/2" BSPP	A4G	S4G**	-	-

**Housing with slot

8 Free flow crack pressure
A - 1,7 bar (25 psi) (standard)
B - 0,28 bar (4 psi) (anti-cavitation)

9 Pressure range
30 - 35-210 bar (500-3000 psi)
50 - 175-350 bar (2700-5000 psi)

10 Pressure setting (optional)
 (Specified by customer in 100 psi increments) for example:
20 - 140 bar (2000 psi)
35 - 240 bar (3500 psi)

11 Special features
00 - None
 (Only required if valve has special features, omit if 00)

Dimensions

mm (inch)

Torque cartridge in housing:
A - 81-95 Nm (60-70 ft.lbs)
S - 102-115 Nm (75-85 ft.lbs)

Note
 Turn screw or knob clockwise to reduce pressure setting and release load.

MCV1-16

Motion control valve

Description

The MCV1-16 is an inline housing type motion control or load holding valve. This valve controls a moving load and prevents loads from running ahead of a pump. It will also lock or hold a load in any position and provides for thermal expansion relief.

Operation

The MCV1-16 is an inline housing type motion control or load holding valve. This

valve controls a moving load and prevents loads from running ahead of a pump. It

will also lock or hold a load in any position and provides for thermal expansion relief.

RATINGS AND SPECIFICATIONS

Performance data is typical with fluid at 21,8 cSt (105 SUS) and 49°C (120°F)

Typical application pressure (all ports)	210 bar (3000 psi)
Rated flow	151 L/min (40 USgpm)
Free flow cracking pressure @ 1 L/min (0.25 USgpm)	13 - 3,4-8,4 bar (50-1300 psi) 35 - 13,6-240 bar (200-3500 psi)
Internal leakage	Port "C" to "V" less than 5 drops/min. max. @ 210 bar (3000 psi)
Temperature range	-40° to 120°C (-40° to 248°F)
Pilot ratio	11:1
Fluids	All general purpose hydraulic fluids such as: MIL-H-5606, SAE 10, SAE 20, etc.
Filtration	Cleanliness code 18/16/13
Standard housing material	Aluminum
Weight	4,50 kg. (10.00 lbs.)
Seal kits (Check valve)	565810 Buna-N 889609 Viton®
Seal kits (Relief valve)	565810 Buna-N 889609 Viton®

MCV1-20

Motion control valve

Description

The MCV1-20 is an inline housing type motion control or load holding valve. This valve controls a moving load and prevents loads from running ahead of a pump. It will also lock or hold a load in any position and provides for thermal expansion relief.

Operation

This valve allows free flow from the "V" port to the "C" port and blocks flow in the opposite direction until either the relief setting is reached or until sufficient pilot pressure has been applied to the "Pilot" port.

RATINGS AND SPECIFICATIONS

Performance data is typical with fluid at 21,8 cSt (105 SUS) and 49°C (120°F)

Typical application pressure (all ports)	210 bar (3000 psi)
Rated flow	190 L/min (50 USgpm)
Free flow cracking pressure @ 1 L/min (0.25 USgpm)	13 - 3,4-8,4 bar (50-1300 psi) 35 - 13,6-240 bar (200-3500 psi)
